

Technical Data

Operating voltage	17—28V DC
Sounder output	
High tone setting volume	nominally 75dB(A) to 91dB(A)
(Complies to EN54:3)	
Low tone setting volume*	nominally 55dB(A) to 75dB(A)

Sound pressure level information published in document PP2203 and isolator operation information published in document PP2090, both available on request.

Current consumption at 24V DC	Sounder Beacon Bases	Sounder Bases	Beacon Bases
quiescent	<300µA	200µA	<300µA
switch-on surge	1.2mA for 1 sec	1.2mA for 1 sec	1.2mA for 1 sec
sounder/beacon operating	8mA	5mA	3.1mA

*Low tone setting does not comply to EN54-3 and should not be used for fire alarm applications

Commissioning

It is important that the base variants be fully tested after installation. An XP95 Test Set, part no 55000-870, may be used to carry out functional testing of individual units. The test set can also perform data integrity tests of an entire system.

Fault Finding

Problem	Possible Cause
No response or missing	Incorrect address setting Incorrect loop wiring (polarity reversed) Too many bases between isolators
Analogue value 1	Sounder failed (if sounder base product)
Analogue value 2	Beacon failed (if beacon base product)
Analogue value 3	Sounder and beacon failed (if sounder beacon base product)
Analogue value 4	Incorrect group address or address setting
Failure to operate	Control panel has incorrect cause and effect programming Incorrect group address setting

Loop-powered Sounder Beacon Base Installation Guide

General

This guide describes the installation of the following base variants

Part number	Product Description
45681-331	Loop-powered Sounder Beacon Base
45681-330	Loop-powered Sounder Beacon Base with isolator
45681-332	Sounder Beacon Base Slow whoop version to Dutch Standard NEN2575 with Isolator
45681-333	Loop-powered Beacon Base with isolator
45681-335	Loop-powered Beacon Base
45681-292	White Cap only (Lockable)
45681-293	Red Cap only (Lockable)

Connect the devices only to control panels using either the XP95 or the Discovery protocol.

The Loop-powered Sounder Beacon Base combines a sounder with a beacon and a detector base in one unit. The beacon is activated whenever the sounder is active and cannot be controlled separately.

All loop-powered base variants with short circuit isolator have a yellow LED which illuminates through the moulding if a short circuit is detected on the loop wiring (see Fig 3).

Note: All loop-powered base variants are not suitable for outdoor use.

Mounting Instructions

All base variants may be secured to a UK standard conduit box or surface mounted (providing there is access through the surface for cabling). If a detector is fitted, lock it if required by screwing in the grub screw in the detector with a 1.5mm hex driver (part no 29600-095).

Wiring Details

Note: These products are polarity sensitive (supply reversal protected) and will not function if wired incorrectly.

All loop-powered base variants without isolator

Connect the positive and negative loop cables to the L2 and L1 terminals respectively, observing polarity. The wiring terminals accept solid or stranded cables up to 2.5mm². Functional earth or screen cables may be terminated to the EARTH connection.

All loop-powered base variants with isolator

Terminate all loop cables in the two way terminal blocks. Connect the incoming loop cables to L1 IN (-) and L2 (+) and the outgoing cables to L1 OUT (-) and L2 (+). Functional earth or screen may be connected to the EARTH connection. The isolator LED can be seen through the moulding as shown in Fig 3.

DO NOT CONNECT LOOP CABLES TO THE OUTER TERMINALS OF ISOLATED MODELS.

When using as a stand-alone unit, a cap is available (red cap part no 45681-293 or white cap part no 45681-292) and is secured with a 1.5mm, AF hexagon socket head screw. A hexagonal driver (part no 29600-095) is available from Apollo.

Address Setting

The address of the loop-powered base variants are set using seven segments of the eight-segment DIL switch. The eighth segment is used to adjust the volume output. Segments 1-7 of the switch are set to "0" (ON) or "1", using a small screwdriver or similar tool. A complete list of address settings is shown below. If a detector is to be fitted, set the address as described on page 3.

addr	DIL switch setting 1234567	addr	DIL switch setting 1234567	addr	DIL switch setting 1234567	addr	DIL switch setting 1234567	addr	DIL switch setting 1234567
1	1000000	11	1101000	21	1010100	31	1111100	41	1001010

								126	0111111

Group Address Setting

In group mode the loop-powered base variants responds to an additional address referred to as the group address, which is used to activate groups of base variants, Integrated Base Sounders and/or 100dB sounders simultaneously. Individual units continue to respond to their own addresses and report their status in the normal way. A group address is set on a four-segment DIL switch which is factory set to 0000. A group address may be any spare address within—and only within—the range 112 to 126 inclusive. The required group address is set in accordance with the following table. For an illustrated example, please see Fig 1.

addr	DIL switch setting 1234	addr	DIL switch setting 1234	addr	DIL switch setting 1234
112	1111	117	0101	122	1010
113	0111	118	1001	123	0010
114	1011	119	0001	124	1100
115	0011	120	1110	125	0100
116	1101	121	0110	126	1000

Note: group mode is disabled if the group address DIL switch is set to 0000, irrespective of the protocol message.

The base variants are tested via the control panel. Output bit 0 is set to 1 on two polling cycles to switch the sounder on which should be tested for at least 5 seconds.

XPERT Card Addressing

Select the desired address and remove the pips indicated in black. Remove pips with a small screwdriver.
